

Flexible EV Charging

Optimizing Charging with Electricity Solutions

Electrifying your fleet can be a complicated process with many moving parts that may influence whether electrification is appropriate for your fleet. With Constellation's Flexible EV Charging solution, we can customize hourly power blocks tailored to your specific charging requirements and mitigate operational and financial risk on a facility-by-facility basis. Our solution helps customers fix the electricity cost of their charging stations as they transition their fleets. Flexible EV Charging can provide many benefits to your business as you decarbonize your fleet including:

Increased Budget Certainty:

Achieve longer-term budget predictability and capitalize on advantageous market conditions.

Risk Optimization:

Limit market exposure by setting a fixed price for a pre-specified quantity (kW) or take advantage of market fluctuations by floating a portion of your load based on your risk tolerance.

Enhanced Flexibility Management:

Find the sweet spot between budget stability and market risk by creating consistency between your load and charging operations.

Constellation can also help you assess your fleet potential through a feasibility assessment and can assist in the development and implementation of charging infrastructure. This integrated electrification offering can help you manage the costs of powering your fleet and further drive decarbonization goals.

Constellation can deliver end-to-end electrification solutions at any point in your business or municipality's decarbonization transition.
